EDUCATIONAL PURPOSE ONLY. This workbook is produced for educational and informational purposes only. It does not constitute financial advice, investment advice, trading advice, or any other form of professional advice.

NOT A REGISTERED ADVISOR. Neither Felix Prehn, Goat Academy, nor any of its affiliates or mentors are registered financial advisors, broker-dealers, or investment professionals under applicable securities regulations.

ALL INVESTMENTS INVOLVE RISK. All investments carry risk, including the potential loss of principal. The value of any investment may fluctuate, and past performance is not indicative of future results. You may lose some or all of the money you invest.

NO GUARANTEES. No representation or warranty is made regarding the accuracy, completeness, or reliability of any information presented. Any examples of past stock performance, returns, or gains referenced in this workbook are historical illustrations and are not promises, projections, or guarantees of future results.

DO YOUR OWN RESEARCH. Before making any investment decisions, you should conduct your own due diligence, consult with a qualified financial advisor, and consider your personal financial situation, risk tolerance, and investment objectives.

NO BUY/SELL RECOMMENDATIONS. This workbook does not contain buy ratings, sell ratings, or price targets on any security. Stock examples referenced are used for educational illustration only.

SIMULATED & HYPOTHETICAL PERFORMANCE. Any references to potential returns or hypothetical outcomes are for illustrative purposes only and do not reflect actual trading results. Simulated performance does not represent actual trading and may not reflect the impact of material economic and market factors.

About Felix Prehn and Goat Academy

Felix Prehn is a former investment banker. He gained deep insights into the strategies and principles that professional investors use to build and protect wealth.

Goat Academy

Felix Prehn is the founder of Goat Academy, an educational platform that has taught over 20,000 students the fundamentals of investing and stock market analysis. Goat Academy focuses on demystifying Wall Street's investment strategies and making them accessible to regular investors.

The academy provides comprehensive training on fundamental analysis, technical analysis, risk management, and portfolio construction—empowering individual investors to make informed decisions about their financial futures.

Tradevision.io

Felix Prehn is also the co-founder of Tradevision.io, a platform dedicated to providing news and data specifically tailored for retail investors. Tradevision.io helps individual investors access the information and tools they need to compete effectively in modern financial markets.

Mission and Dedication

Felix Prehn has dedicated his retirement to teaching regular investors how to protect their wealth and navigate the complexities of the stock market. His approach emphasizes understanding the fundamental principles that drive long-term investment success, rather than chasing short-term trends or speculation.

By bridging the knowledge gap between Wall Street professionals and individual investors, Felix works to level the playing field and help people take control of their financial destinies.

EXECUTIVE SUMMARY

The 90-Day Playbook

This workbook distills the complete 90-day action plan for transforming how you approach the stock market. Built on the same three "Power Moves" that institutional investors use, this playbook gives you the roadmap—week by week, action by action—for building a rules-based investing system from scratch.

Our analysis is clear: the difference between investors who consistently profit and those who consistently lose is not intelligence, luck, or insider connections. It is the presence of a **systematic, rules-based approach** built on tracking institutional money flows. This playbook shows you exactly *what* to do over 90 days to build that system.

THE CORE THESIS

We expect the current market environment—IPO season, sector rotations, and institutional repositioning—to create significant opportunities for prepared investors. The 90-day window ahead is not just important. It may be **the most consequential quarter** for retail investors in a decade. Those who enter it with the right skills, the right tools, and the right system will be positioned to capture moves that most investors will watch from the sidelines.

The Three Power Moves

1. Volume Spikes

When trading volume surges 300%+ above average, it signals institutional money deploying capital with conviction. This is the single most reliable signal that "smart money" is moving.

2. The Heartbeat Pattern

Stocks consolidating sideways for extended periods build a "coiled spring." When they break above with volume confirmation, the resulting moves can be substantial—often 10X or more.

3. The Record Quarter

Companies reporting their best-ever earnings attract fresh institutional attention, narrowing 30,000+ stocks to a handful of high-probability setups.

The Triple Confirmation

When all three align on a single stock, our analysis suggests the highest-probability setup available to retail investors. These confluences are rare—and valuable.

BOTTOM LINE: This playbook gives you the complete *what* and *when*—every action, every milestone, every checkpoint for 90 days. The *how*—the deeper skill of reading charts with confidence, managing risk under pressure, and executing with the discipline of a professional—is what separates those who read playbooks from those who profit from them. Our analysis suggests that investors who combine this roadmap with guided skill development will dramatically outperform those who attempt to execute it alone.

Why 90 Days Changes Everything

Why 90 days? Because it is the minimum time required to build a genuine skill—not just awareness, not just interest, but actual competence. As Felix Prehn explains: *"There is no skill worth learning that you can fully master in 2 hours. Driving, swimming, hitting a ball—all take more than that. Managing your money is the same."*

The 90-day framework is structured around three levels of learning:

Level	What It Is	Timeline
Level 1: Foundation	Awareness, safe concepts, understanding the basics	Weeks 1–2
Level 2: Application	The actual system, rules, and frameworks applied to real charts	Weeks 3–8
Level 3: Mastery	Where it all fits together—experience, pattern recognition, psychology	Weeks 9–12+

The Driving Analogy

Consider this: nobody learns to drive by sitting alone in a car and figuring it out. Someone teaches you the rules—stop on red, stay in your lane, signal before turning. And because of that, you have been driving safely for years. Now consider: when you first opened a brokerage account, did anyone teach you the rules? Did anyone sit next to you and show you how the professionals actually operate?

This playbook is your **roadmap**. It tells you exactly where to go and when. But just as a roadmap cannot teach you to drive, this document cannot teach you to execute. The skill of reading charts with confidence, the discipline of placing buy and sell orders simultaneously, the psychology of watching a position drop and *trusting* your system—these require practice, feedback, and guided experience.

WHAT THIS PLAYBOOK WILL DO FOR YOU

- ✓ Give you a complete week-by-week action plan for 90 days
- ✓ Show you exactly which skills to develop and in what order
- ✓ Provide checklists, frameworks, and benchmarks for every phase
- ✓ Help you identify where your gaps are so you can address them
- ✓ Set you up with the infrastructure to follow the money like a professional

The Three-Month Architecture

The 90-day plan is divided into three distinct phases. Each phase builds on the previous one, creating a compounding effect that accelerates your development. Skip a phase, and the entire structure weakens.

◆ MONTH 1: FOUNDATION (WEEKS 1–4)

Objective: Build your infrastructure, set up your tools, and develop basic pattern recognition.

Key Deliverables:

- Brokerage account confirmed and configured
- Charting platform with volume indicators set up
- Volume alerts (300%+ threshold) active on 10+ stocks
- Fundamental screener with record quarter filtering capability
- First 10 charts analyzed for heartbeat patterns
- Personal "Why" statement written and posted visibly

Skills required: Basic charting platform navigation, understanding of volume bars, alert configuration

◆ MONTH 2: APPLICATION (WEEKS 5–8)

Objective: Apply the three Power Moves to real market data, build your watchlist, and begin paper trading.

Key Deliverables:

- Weekly watchlist maintained (minimum 15 stocks across sectors)
- First 6 paper trades executed with documented rationale
- Triple confirmation framework applied to every candidate
- Stop-loss strategy defined and tested in simulation
- Position sizing model built for your portfolio
- Weekly review routine established (15–30 minutes)

Skills required: Chart reading under time pressure, stop-loss calibration, sector analysis, position sizing math

◆ MONTH 3: EXECUTION (WEEKS 9–12)

Objective: Transition from paper trading to real capital deployment with a defined risk budget.

Key Deliverables:

- First live trades executed using the smallest position size in your model
- Complete protocol on every trade: breakout buy + simultaneous stop-loss
- Trailing stop strategy implemented on profitable positions
- 1–2 additional live positions managed with full risk protocol
- Full 90-day performance review completed (win rate, average gain/loss, vs. index)
- Skill Gap Assessment retaken, showing improvement from Week 1

Skills required: Live execution discipline, trailing-stop management, emotional regulation under real capital

Month 1: Building Your Infrastructure

The first month is about preparation—not action. Just as a builder does not swing a hammer until the blueprints are finalized and the materials are on site, you do not look at a single stock until your infrastructure is in place.

WEEK 1: SETUP & ORIENTATION

- ▶ Confirm or open your brokerage account (US: Thinkorswim/Schwab; International: Interactive Brokers)
- ▶ Set up your charting platform with volume indicators visible
- ▶ Create your first volume alert: Volume moves up by 300% on any stock you currently own
- ▶ Write your personal "Why" statement — what motivates you to build this skill?
- ▶ Set up a dedicated notebook or spreadsheet for tracking your 90-day progress

Skill Check: Week 1

Can you navigate your charting platform and locate the volume bars at the bottom of a chart? Can you distinguish between green (buying) and red (selling) volume candles? Can you configure a volume alert that will notify your phone? If any of these feel uncertain, you are encountering your first skill gap. This is normal—and it is exactly the kind of gap that guided instruction solves in minutes.

WEEK 2: LEARNING TO SEE VOLUME

- ▶ Pull up 10 random stock charts and identify every volume spike above 300% of the average
- ▶ For each spike, note: Was it green or red? What happened to the price in the following 5 days?
- ▶ Study the historical volume patterns of Tesla, Palantir, and Rocket Lab
- ▶ Learn the candle color warning: pre-market and after-hours activity is NOT reflected in candle color
- ▶ Set up volume alerts on at least 5 additional stocks across different sectors

WEEK 3: PATTERN RECOGNITION BASICS

- ▶ Study the heartbeat pattern: identify sideways consolidation ranges on 10 charts
- ▶ For each, note: How long has the consolidation lasted? What are the upper and lower boundaries?
- ▶ Learn to identify false breakouts vs. confirmed breakouts (volume confirmation required)
- ▶ Access a fundamental screener and apply the "Record Quarter" filter for the first time
- ▶ Document: How many stocks pass the record quarter filter? (Typically 2–5 out of 30,000)

Month 2: Identifying Opportunities

Month 2 is where the system comes alive. You transition from passive learning to active analysis. You are no longer just looking at charts—you are reading them. You are no longer just setting alerts—you are acting on them.

WEEK 5: BUILDING YOUR WATCHLIST

- ▶ Conduct your first full weekly research session (1–2 hours)
- ▶ Scan across sectors: Semiconductors, AI, Fintech, Aerospace, Consumer, Precious Metals
- ▶ Apply the triple confirmation framework to every stock that triggers a volume alert
- ▶ Build a watchlist of 15+ stocks organized by sector
- ▶ For each stock, document: heartbeat duration, breakout level, volume status, record quarter status

Skill Check: Week 5

Can you conduct a sector-wide scan in under 2 hours and identify the 3–5 strongest candidates? Can you distinguish between a stock that is **breaking out** and one that is merely **bouncing within its range**? Can you identify the exact price level above which a breakout is confirmed? These distinctions require *trained judgment*—the kind that develops through guided practice, not through reading alone.

WEEK 6: PAPER TRADING BEGINS

- ▶ Execute your first 2 paper trades using the breakout buy strategy
- ▶ For each trade: place the buy order AND the stop-loss simultaneously
- ▶ Calibrate your stop-loss to the stock's volatility (not a flat percentage)
- ▶ Document your reasoning: Why this stock? What confirmed the setup?
- ▶ Track daily: Did the trade move in your favor? Did your stop hold?

THE STOP-LOSS CALIBRATION CHALLENGE

A stock that moves 3–4% per day requires a very different stop-loss than one that moves less than 1%. If you set a 4–6% stop on a highly volatile stock, you will be "knocked out" by normal daily fluctuation within 2–3 days. Calibrating stops to volatility is one of the most important—and most nuanced—skills in the system. **Getting this wrong costs real money.** This is precisely where one-on-one coaching delivers the greatest value.

Month 3: Executing with Confidence

Month 3 is the moment of truth. The infrastructure is built. The patterns have been studied. The paper trades have been documented. Now the question becomes: **can you execute under real conditions?**

WEEK 9: FIRST LIVE TRADES

- ▶ Deploy real capital for the first time using the smallest position size in your model
- ▶ Execute the complete protocol: breakout buy + simultaneous stop-loss
- ▶ Start with your highest-conviction setup from the watchlist
- ▶ Monitor the trade daily but do NOT adjust your stop based on emotion
- ▶ Document everything: your emotional state, what you wanted to do vs. what the system said

The Emotional Execution Gap

Here is what nobody warns you about: executing with real money *feels completely different* from paper trading. When your position drops 5% on day two, every instinct screams "SELL!" When it rises 10%, every instinct screams "TAKE PROFITS!" Neither instinct is correct. The system—not your feelings—dictates action. **This psychological discipline is the single most important skill in investing**, and it is the one that is most difficult to develop alone. It is also why 90% of investing success is ultimately mindset.

WEEK 10: TRAILING STOPS & POSITION MANAGEMENT

- ▶ Implement trailing stop strategy: move stop-loss up as the stock makes new highs
- ▶ After first rally: move stop to approximately breakeven
- ▶ After second rally: move stop to lock in some profit
- ▶ Evaluate portfolio diversification: are you concentrated in one sector?
- ▶ Execute 1–2 additional positions with full risk management protocol

WEEK 11: ADVANCED APPLICATION

- ▶ Apply the "pay more" principle: set conditional buy orders above resistance levels
- ▶ Practice the phased entry approach: first buy on breakout, second buy on pullback
- ▶ Analyze what NOT to buy: identify falling knives with institutional selling (e.g., downward-sloping moving averages)
- ▶ Review the moving average direction rule: never buy when the slope is downward

The Follow the Money System

Everything in this playbook rests on one principle: **follow the actual money, not opinions, not headlines, not gut feelings.**

THE SURFING ANALOGY

You can buy the greatest business in the world—the best leadership, the best products, the best financials—and you can still lose money. Why? Because if Wall Street sells it, the price drops. You are fighting against billions of dollars. It is like a wave coming at you, and you are trying to swim through it. You cannot. But when you follow that institutional money—when you ride the wave like a surfer does—everything changes.

What this means in practice:

What We Track	What We Ignore
The quantity of shares institutions are buying	Television pundits and talking heads
Whether that number is increasing or decreasing	Social media tips and "hot picks"
The direction of volume bars on the chart	Gut instincts and emotional reactions
Green volume spikes on up days = buying	Whether we personally "like" the company
Red volume spikes on down days = selling	Headlines and narratives

This Is NOT Timing the Market

Timing the market—trying to buy at the absolute bottom and sell at the absolute top—is a fool's errand. It is impossible because you never know you are at the top until the top is behind you. What we do instead is **follow the money trail**. Institutions move billions of dollars and leave enormous, obvious, elephant-sized tracks. We are learning to see those tracks and follow them. That is the entire game.

This system requires five distinct skills, each building on the previous one. The following pages outline each skill, what it involves, and—honestly—what level of mastery you will need to execute this playbook effectively.

SKILL #1

Volume Analysis

Volume is the heartbeat of the market. When you see a massive spike in trading volume—often 300% to 1,000% above average—it typically means that institutional money is making a significant move.

THE RULE

Volume equals power. High volume means institutions are moving in. Low volume means it is noise—amateurs trading with each other while the professionals sit on the sidelines. You want to invest where there is volume.

What You See	What It Means	What You Do
Large green volume bar on an up day	Institutions are buying aggressively	Potential opportunity — investigate further
Large red volume bar on a down day	Institutions are selling aggressively	Warning signal — proceed with extreme caution
Small volume bars (any color)	No institutional interest; noise	Wait. Nothing actionable here yet
Volume spike 300%+ above average	Something significant is happening	Pay attention. Check for breakout coincidence

SKILL #2

Reading the Heartbeat Pattern

Every stock that is about to make a major move has a rhythm—just like your heart beats before you take action. The market has a "heartbeat" before it explodes, and learning to recognize this pattern is one of the most valuable skills an investor can develop.

THE PATTERN EXPLAINED

A stock runs up significantly, then crashes or sells off. It then enters a sideways consolidation range—moving neither significantly up nor significantly down—for an extended period. This sideways range IS the heartbeat pattern. Think of it as a coiled spring: **the longer it stays compressed, the more powerful the eventual breakout tends to be.**

The Anatomy of a Heartbeat Pattern:

- 1 **The Initial Move:** The stock experiences a significant rally or decline, establishing a price range.
- 2 **The Consolidation:** The stock enters a sideways trading range, bouncing between resistance and support.
- 3 **The Duration:** For potential 10X movers, this typically lasts 2–4 years. Shorter patterns (3–6 months) produce smaller but meaningful rallies.
- 4 **The Breakout:** The stock closes above the upper boundary with a significant volume spike.
- 5 **The Rally:** The stock enters a new trending phase that can produce substantial gains.

Stock	Heartbeat Duration	Breakout Signal	Result
Tesla	~3 years (2017–2019)	Volume spike 10X in early 2020	~10X from breakout
Palantir	Multi-year consolidation	Volume exploded 10X	~10X from breakout
Rocket Lab	~2 years sideways	Massive volume spike after earnings	~1,500% in 417 days
Sezzle	Extended period at ~\$1	Record earnings + volume explosion	10X (10-bagger)
Intel	Years of "dead company"	Massive volume surge Aug–Sep	Up 391% from breakout

SKILL #3

Identifying Record Quarters

Most investors check whether a company is "growing" or "profitable." But the most skilled investors look deeper—they look for companies reporting their **best earnings quarter ever**. This is the "Record Quarter," and our analysis suggests it is one of the most powerful catalysts for major stock moves.

WHY RECORD QUARTERS MATTER

When a company reports its best-ever earnings—particularly when it transitions from losing money to making money—it sends a powerful signal to institutional investors. Combined with volume spikes and a heartbeat pattern breakout, a record quarter creates the "**triple confirmation**" that professional investors look for.

EPS Pattern	Signal	Interpretation
Most recent quarter is highest ever	● Strong	Record quarter confirmed
Transition from negative to positive EPS	● Very Strong	Inflection point — company turned profitable
Increasing EPS but not yet at record	● Moderate	Worth monitoring for future record quarter
Declining EPS	● Weak	Deteriorating fundamentals — proceed with caution

The Screening Power

Out of approximately 30,000 globally listed stocks, the record quarter filter typically narrows the field to a **handful**. When Felix screened for AI infrastructure stocks with record quarters, only 2 stocks qualified. This dramatic reduction is what makes the tool so powerful—it eliminates 99.99% of the noise and focuses your attention on the stocks with the strongest fundamental catalysts.

Stock	Record Quarter Trigger	Result
Credo Technology	Reported best-ever earnings; transitioned to profitability at ~\$20	Rose approximately 10X to ~\$216
Celsius (CELH)	First profitable quarter; best EPS ever	Rose from ~\$7 to \$30–40 range

SKILL #4

Risk Management Execution

Finding great stocks is only half the equation. The other half—which ultimately determines whether you are profitable—is **risk management**. It is not the glamorous part, but it is the part that keeps you in the game.

Stop-Loss Placement

Volatility	Daily Move	Stop Approach
High volatility	3–4%+ per day	Wider stop (20–25% below entry)
Medium volatility	1–2% per day	Moderate stop (10–15% below entry)
Low volatility	<1% per day	Tighter stop (5–8% below entry)

CRITICAL RULE

Always place your buy order and your stop-loss order at the same time. This removes emotion from the equation. If a stock hits your stop level, it sells automatically. This is how professionals manage risk and avoid the "holding and hoping" trap.

Position Sizing: The 1% Rule

# of Stocks	Each as % of Portfolio	Impact of 20% Drop in One
5 stocks	20% each	–4.0% portfolio (painful, sleep-disrupting)
15 stocks	~6.7% each	–1.3% portfolio (uncomfortable but manageable)
30 stocks	~3.3% each	–0.66% portfolio (barely noticeable)

THE TRAILING STOP CHALLENGE

Moving your stop-loss up as a stock rallies sounds simple in theory. In practice, it requires answering questions like: How much room do I give it? When do I move to breakeven? How do I avoid getting "knocked out" by normal volatility? Too tight, and I exit a winning position prematurely. Too loose, and I give back too much profit. **Trailing stop management is described by experienced traders as "an art"**—it requires calibrating to each stock's unique volatility profile and adjusting over time.

SKILL #5

The Psychology of Discipline

Felix states it directly: *"90% of investing success is mindset."* The technical rules are important, but the ability to follow them consistently—especially when emotions are running high—is what separates successful investors from the crowd.

Emotional Traps to Avoid	Professional Habits to Build
FOMO: Buying because everyone else is buying	System: Follow rules, not feelings
Hope: Holding a loser, hoping it recovers	Automation: Use stop losses and conditional orders
Fear: Selling at the worst moment during a pullback	Routine: Review positions weekly, not hourly
Ego: Refusing to admit a trade was wrong	Accountability: Share your plan with a mentor
Revenge: Trying to "make back" losses with risky trades	Patience: Wait for confirmed setups before committing

A PERSPECTIVE SHIFT

Your savings are not just a number on a screen. They represent every morning you got up and did not want to, every vacation you did not take, every luxury you skipped. It is not capital—it is literally **your life stored in a brokerage account**. Treating it with the same care, discipline, and skill that you would apply to any other critical life decision is not optional. It is essential.

The Investing Paradox

Most people will spend 2 weeks researching a vacation—reading reviews, comparing hotels, finding the best flight deals. But those same people will buy a stock based on a YouTube video, a tip from a friend, or a gut feeling, and then hold it while it drops 30%, 40%, 50%... because they do not have a plan. It is not because they do not care about their money. **It is because nobody ever sat them down and taught them the rules.**

The Skill Gap Assessment

Before proceeding to the week-by-week action plan, take an honest assessment of where you stand on each of the five critical skills. Rate yourself on a scale of 1 (no competence) to 10 (complete mastery).

Skill	What "Competent" Looks Like	Your Rating (1–10)
Volume Analysis	Can identify institutional buying/selling on any chart within 30 seconds, distinguishing real signals from noise	_____
Heartbeat Pattern	Can identify consolidation ranges, breakout levels, and confirmed vs. false breakouts in real time	_____
Record Quarters	Can screen for record quarter stocks and evaluate EPS trends to identify inflection points	_____
Risk Management	Can calibrate stop-losses to volatility, size positions using the 1% rule, and trail stops systematically	_____
Emotional Discipline	Can follow the system rules even when a position is down, without panic-selling or deviating from the plan	_____

Interpreting Your Results

Total Score	Assessment	Recommendation
40–50	Advanced — ready for live execution	Proceed with Month 3 immediately; consider mentorship for fine-tuning
25–39	Intermediate — strong foundation, gaps in execution	Follow the full 90-day plan; seek guidance on weakest areas
10–24	Beginner — significant gaps in multiple areas	Extend Month 1 by 2 weeks; strongly consider guided mentorship
Below 10	Starting from zero — everything to learn	This playbook provides the roadmap; guided instruction provides the vehicle

BOTTOM LINE: If you scored below 30 on this assessment, you now have clarity on something valuable: **you know exactly what you need to learn.** The gap between where you are and where you need to be is not intelligence—it is skill. And skills are learnable, teachable, and masterable. The question is whether you want to close that gap over 3 years of trial and error, or over 90 days with guided instruction.

Weeks 1–4: Building Your Foundation

Every action in this section is designed to be completed by an investor working 3–5 hours per week. If you have more time, you can accelerate. If you have less, extend the timelines proportionally.

WEEK 1: INFRASTRUCTURE SETUP

- ▶ Open or confirm brokerage account (US: Thinkorswim; International: Interactive Brokers)
- ▶ Set up charting platform with volume indicators visible at the bottom of every chart
- ▶ Create your first volume alert: Volume moves up by 300% on a stock you currently own
- ▶ Access a fundamental screening tool with Record Quarter filtering
- ▶ Write your personal "Why" statement and post it where you will see it daily
- ▶ Set up a dedicated tracking spreadsheet: Date, Stock, Signal, Action Taken, Result
- ▶ Schedule your weekly review session: same day, same time, every week

△ Skill required: Navigating charting platforms, understanding alert configuration. If uncertain, this is your first indicator that structured learning would accelerate your progress.

WEEK 2: VOLUME LITERACY

- ▶ Pull up 10 random stock charts and identify every volume spike above 300%
- ▶ For each spike, record: Green or red? What happened to the price in the next 5 trading days?
- ▶ Study the historical charts of Tesla (2017–2020), Palantir, and Rocket Lab
- ▶ Learn the candle color warning: pre-market drops can create misleading green candles
- ▶ Set up volume alerts on 5 additional stocks across different sectors
- ▶ Read one case study in detail: How did Sezzle go from \$1 to a 10-bagger?
- ▶ Begin building your "Volume Playbook" — a personal reference of what different volume patterns mean

WEEK 3: PATTERN RECOGNITION

- ▶ Study the heartbeat pattern concept: identify consolidation ranges on 10 charts
- ▶ For each, draw the upper resistance and lower support boundaries
- ▶ Estimate: How long has this consolidation lasted? (Longer = more powerful potential)
- ▶ Identify 3 charts where a breakout has already occurred — study what happened next
- ▶ Apply the Record Quarter screener for the first time: How many stocks qualify?
- ▶ Attempt the triple confirmation on 3 stocks: Volume + Heartbeat + Record Quarter

△ Skill required: Real-time pattern identification (not hindsight). Can you spot a heartbeat forming before the breakout? This is the difference between Level 2 and Level 3 competence.

WEEK 4: MONTH 1 SYNTHESIS

- ▶ Review all volume alerts triggered this month — document patterns and outcomes
- ▶ Compile your first watchlist: 5–10 stocks showing potential setups
- ▶ For each watchlist stock, note: breakout price, stop-loss level, position size
- ▶ Write a self-assessment: What feels confident? What feels uncertain?
- ▶ Complete the Skill Gap Assessment on page 20
- ▶ Decision point: Are you ready for Month 2, or should you repeat pattern recognition for one more week?

Month 1 Milestone Checklist

BEFORE PROCEEDING TO MONTH 2, CONFIRM:

- ☐ I can open any stock chart and immediately identify the volume bars
- ☐ I can distinguish between green (buying) and red (selling) volume candles
- ☐ I can identify a volume spike above 300% of the average
- ☐ I can identify a sideways consolidation range (heartbeat pattern) on a chart
- ☐ I can use a fundamental screener to find stocks with Record Quarters
- ☐ I have active volume alerts on at least 10 stocks
- ☐ I have a watchlist of at least 5 stocks I am monitoring
- ☐ I have a weekly review session scheduled and have completed at least 2 sessions
- ☐ I have written my personal "Why" statement

The Month 1 Reality Check

If you completed every item on this checklist, you are ahead of 95% of retail investors. You now have the **infrastructure** and the **conceptual understanding** to begin applying the system. But here is the honest question you must ask yourself: *"When I look at a chart, do I feel confident in what I see—or am I guessing?"*

If you are guessing, that is not a failure. It is a data point. It tells you that **the gap between knowing the rules and applying them with confidence** is wider than a playbook alone can bridge. This is precisely where most investors stall—and precisely where guided mentorship accelerates progress from months to weeks.

What Confident Chart Reading Actually Looks Like

When a mentor's student pulls up a chart on a one-on-one coaching call, the conversation sounds like this:

"I see a heartbeat pattern that's been forming for about 8 months. The upper boundary is at \$24. Volume has been quiet—all noise, no institutional interest. But last Thursday, we got a 400% volume spike on a green candle, and the stock closed at \$24.80—above resistance for the first time. I want to place a buy order at \$25 with a stop at \$21, which gives me about 16% downside risk. Given the stock's daily volatility of about 2%, that stop should survive normal fluctuation. My position size would be about 3% of my portfolio."

That level of articulation—knowing exactly *what* you see, *why* it matters, and *what to do about it*—is what the next 8 weeks aim to build.

Weeks 5–8: Identifying Opportunities

This is where the system comes alive. You are no longer just observing the market—you are analyzing it with purpose, building hypotheses, testing them with paper trades, and developing the muscle memory of a systematic investor.

WEEK 5: YOUR FIRST FULL RESEARCH SESSION

- ▶ Block 2 hours for your first comprehensive weekly research session
- ▶ Scan across sectors: Semiconductors, AI Infrastructure, Fintech, Aerospace, Consumer, Metals
- ▶ Apply the triple confirmation framework to every stock that triggered a volume alert this week
- ▶ Build your expanded watchlist: minimum 15 stocks organized by sector
- ▶ For each stock, document: Heartbeat status, Breakout level, Volume status, Record Quarter status
- ▶ Identify your "breakout buy" prices — the price ABOVE resistance at which you would enter

THE "PAY MORE" PRINCIPLE

One of the most counterintuitive concepts in this system: **professional investors deliberately pay MORE for a stock than its current trading price.** If a stock is trading at \$16 and resistance is at \$20, you set a buy order at \$20.50. Why? Because if the stock breaks through resistance, the probability of continued upward movement increases. You are paying a premium for higher probability. This goes against every instinct—but it is what separates professional entries from retail entries.

WEEK 6: PAPER TRADING EXECUTION

- ▶ Execute your first 2 paper trades using the breakout buy strategy
- ▶ For each trade, simultaneously place: buy order above resistance + stop-loss below breakout
- ▶ Document your full rationale: Which Power Moves confirmed this setup?
- ▶ Calibrate your stop-loss to the stock's actual volatility (NOT a flat percentage)
- ▶ Monitor daily: Did the position move in your favor? Is the stop holding?
- ▶ Note your emotional reactions: Did you feel the urge to deviate from the plan?

△ Critical skill required: Stop-loss calibration to volatility. A 4–6% stop on a stock that moves 3–4% daily will knock you out within 2 days. This calibration is one of the most nuanced skills in the system.

WEEK 7: POSITION SIZING & PORTFOLIO CONSTRUCTION

- ▶ Calculate your total portfolio risk budget using the 1% rule
- ▶ Determine your optimal number of positions (15–30 for most portfolios)
- ▶ Execute 2 more paper trades with proper position sizing applied
- ▶ Practice the "second chance" entry: buying on a pullback to the breakout level
- ▶ Assess sector concentration: Are you overexposed to one industry?
- ▶ Review all 4 paper trades to date — identify patterns in your decision-making

WEEK 8: MID-POINT ASSESSMENT & TRANSITION PLANNING

- ▶ Complete 6 total paper trades with full documentation
- ▶ Calculate your simulated return: net positive or negative?
- ▶ Identify your most common mistake: entry timing? stop placement? position sizing?
- ▶ Refine your watchlist based on what you have learned
- ▶ Begin preparing your transition plan for Month 3: live capital deployment
- ▶ Retake the Skill Gap Assessment — have your ratings improved?

Month 2 Milestone Checklist

BEFORE PROCEEDING TO MONTH 3, CONFIRM:

- ☐ I have completed 6 paper trades with documented rationale and results
- ☐ I can articulate *why* I entered each trade, where my stop was, and what would trigger an exit
- ☐ I have maintained a watchlist of 15+ stocks for at least 3 consecutive weeks
- ☐ I have conducted at least 3 comprehensive weekly research sessions
- ☐ I understand position sizing and can calculate appropriate sizes for my portfolio
- ☐ I have experienced at least one paper trade that went against me and respected my stop
- ☐ I have identified my most common decision-making weakness

THE MONTH 2 GUT CHECK

Here is the most important question at the halfway point: **Are you ready to commit real capital?**

If you hesitate, that hesitation is intelligence, not weakness. It means you recognize that there is a gap between *understanding the system* and *executing it with confidence under real pressure*. Most retail investors skip this moment of self-awareness and jump straight to real money—which is why most retail investors lose money.

If you are not yet confident, you have two options: (1) extend Month 2 by 2–4 weeks with additional paper trading, or (2) accelerate your skill development with guided mentorship that provides real-time feedback on your specific charts and decisions.

The Confidence Gap Most Investors Face

In the live webinar, Felix asked the audience to rate their confidence in finding the next big stock on a scale of 1 to 10. The average answer was about 5. After two hours of teaching, the average remained around 5–6.

This is not a failure of the teaching—it is an honest reflection of reality. **True confidence comes from doing, not from learning.** It comes from pulling up a chart, making a call, watching the outcome, getting feedback, and doing it again. And again. And again.

Student Perspective

"I learn more in 6 weeks with guidance than 3 years on my own." — Goat Academy student. The difference is not the content—it is the **feedback loop**. When a mentor reviews your specific chart analysis and says, "You identified the heartbeat perfectly, but your stop is too tight for this stock's volatility—here's why," you learn in 5 minutes what would take months of trial and error.

Weeks 9–12: Executing with Confidence

This is where everything you have built comes together. The infrastructure is in place. The patterns have been studied. The paper trades have been completed. Now you deploy real capital—methodically, systematically, and with the discipline of someone who has a plan.

WEEK 9: FIRST LIVE TRADES

- ▶ Select your highest-conviction setup from your current watchlist
- ▶ Deploy real capital using the SMALLEST position size in your model
- ▶ Execute the complete protocol: breakout buy + simultaneous stop-loss
- ▶ Set the stop-loss calibrated to the stock's actual volatility
- ▶ Document: Your emotional state at the moment of execution
- ▶ DO NOT check the position more than once per day this week
- ▶ Document: What you wanted to do vs. what the system said to do

WEEK 10: MANAGING LIVE POSITIONS

- ▶ If your position is in profit: begin trailing your stop-loss upward
- ▶ After first rally: move stop to approximately breakeven
- ▶ After second rally: move stop to lock in some profit
- ▶ Execute 1–2 additional live positions (maintaining position size limits)
- ▶ Evaluate portfolio sector diversification
- ▶ Continue weekly research and watchlist maintenance
- ▶ If your stop was triggered: document the exit. Did you follow the rules?

The Emotional Execution Gap — Live Capital Edition

In paper trading, a 5% drop is a number on a spreadsheet. With real money, a 5% drop is **the vacation you won't take, the contribution you can't make to your child's college fund, the setback to retirement.** The emotional weight of real capital creates an entirely different psychological landscape. Every impulse screams: "Fix it. Do something. Sell. Buy more. Change the plan." The professional response: **"Follow the system. Trust the process. The stop-loss will handle risk. My job is to do nothing until the system says otherwise."**

Developing this discipline alone is possible. Developing it with a mentor who has managed money through multiple market cycles is *faster, cheaper, and significantly less painful.*

WEEK 11: ADVANCED APPLICATION

- ▶ Apply the "pay more" principle on a conditional buy order above resistance
- ▶ Practice phased entries: first buy on breakout, second buy on pullback to support
- ▶ Identify what NOT to buy: stocks with institutional selling and downward-sloping moving averages
- ▶ Review the moving average direction rule: **never buy when the slope is downward**
- ▶ Assess whether any current positions need their stops adjusted
- ▶ Continue weekly research and position review

WEEK 12: THE 90-DAY REVIEW

- ▶ Complete full performance review: total trades, win rate, average gain, average loss
- ▶ Identify your top 3 strengths in the system
- ▶ Identify your top 3 remaining skill gaps
- ▶ Calculate: total portfolio return over 90 days
- ▶ Compare: your return vs. a passive index fund over the same period
- ▶ Set specific, measurable goals for the next 90 days
- ▶ Make the decision: continue self-directed, or accelerate with mentorship?

Month 3 Milestone Checklist

90-DAY COMPLETION CRITERIA:

- ☐ Completed a minimum of 12 trades (simulated + live combined)
- ☐ Every trade documented with: entry rationale, stop placement, position size, outcome
- ☐ Followed the triple confirmation framework on every entry
- ☐ Placed buy and stop-loss orders simultaneously on every trade
- ☐ Maintained position risk below 1% of total portfolio on every trade
- ☐ Conducted weekly research sessions for at least 10 of the 12 weeks
- ☐ Maintained a watchlist continuously for at least 8 weeks
- ☐ Completed the final Skill Gap Assessment showing improvement from Week 1

The Weekly Review Protocol

Throughout the 90 days, your weekly review session (15–30 minutes) should follow this exact protocol:

Step	Action	Time
1	Review all active positions: Is each still following the system rules?	5 min
2	Check all volume alerts triggered this week: any new opportunities?	5 min
3	Update your watchlist: add new candidates, remove ones that no longer qualify	5 min
4	Adjust trailing stops on profitable positions	5 min
5	Set conditional buy orders for next week's breakout candidates	5 min
6	Journal: What went well this week? What needs improvement?	5 min

The Power of Routine

Felix reviews his positions once per week—not hourly, not daily. He sets up buy and sell orders on Sundays, and then goes about his life. *"I try to do very little,"* he says. *"And it allows me to do other things, which is really the whole point here."* The weekly review protocol gives you the same systematic approach. But executing it requires confidence that your system is sound—confidence that comes from skill, practice, and trusted guidance.

Quick-Reference Rules Checklist

Bookmark this page. Reference it before every investment decision.

Before You Buy — The Confirmation Checklist

✓	Rule	What to Look For
☐	Volume Spike	Has trading volume increased 300%+ above the recent average?
☐	Green Volume	Are the volume spikes occurring on UP days (green candles)?
☐	Heartbeat Pattern	Has the stock been consolidating sideways for at least 3+ months?
☐	Breakout Confirmed	Has the stock closed ABOVE the upper boundary of the range?
☐	Record Quarter	Has the company reported its best-ever earnings (or turned profitable)?
☐	Moving Average	Is the moving average line sloping UPWARD? (Never buy when sloping down)
☐	Stop Loss Set	Have you placed a stop-loss order at the SAME TIME as your buy order?
☐	Position Size	Is your total risk on this position $\leq 1\%$ of your overall portfolio?

After You Buy — The Management Rules

✓	Rule	What to Do
☐	Trail Your Stop	Move stop-loss up as the stock makes new highs to protect gains
☐	Monitor Volume	Watch for declining volume or large red spikes (institutional selling)
☐	Second Chance Adds	Consider adding to winners on pullbacks to the breakout level
☐	Weekly Review	Check all positions once per week — not hourly or daily
☐	Exit When They Exit	If you see heavy institutional selling, respect your stop
☐	Redeploy Capital	When a position exits, find the next confirmed setup

Why Most Investors Fail the 90-Day Window

You now have the complete playbook. Every week is mapped. Every action is specified. Every milestone is defined. And yet, our analysis suggests that the majority of investors who read a plan like this will not execute it successfully.

This is not a reflection of intelligence. It is not a reflection of effort. **It is a reflection of three critical skill gaps that no playbook, no matter how detailed, can fully close on paper.**

The Three Critical Skills Most Investors Lack

Gap #1: Real-Time Pattern Recognition

Identifying a heartbeat pattern on a historical chart is easy—the breakout has already happened. Identifying one *in real time*, while the stock is still boring and sideways, before anyone else sees it, is an entirely different skill.

This playbook teaches you what patterns look like. **It cannot teach you to see them under pressure, at speed, with real money on the line.** That requires dozens of hours reviewing live charts with someone who can point out what you are missing—the subtle volume shift you overlooked, the resistance level you drew incorrectly, the false breakout you would have fallen for.

Felix spent years mastering this skill with Wall Street mentors. His oldest mentor learned it in the 1970s. Pattern recognition at this level is transferred person-to-person, not page-to-page.

Gap #2: Volatility-Calibrated Risk Management

You know the rules: place buy and stop-loss simultaneously, keep risk below 1%, trail your stops upward. But the rules do not tell you **where** to place your stop on *this specific stock, with this specific volatility profile, in this specific market environment*.

A stock that moves 3–4% daily needs a 20–25% stop. A stock that moves less than 1% needs a 5–8% stop. Getting this calibration wrong costs real money—either you get knocked out of winning positions by normal volatility, or you let losing positions run too far before the stop triggers.

Felix describes stop-loss management as "an art." His mentors "literally wrote the book on this." This calibration skill is developed through repetition under guided supervision, not through formulas alone.

Gap #3: Emotional Execution Under Capital Pressure

This is the gap that defeats the most investors. You know the system says "hold." Your stomach says "sell." You know the system says "wait for the breakout." Your FOMO says "buy now before it runs without you."

In this moment, your skill—not your knowledge—determines the outcome.

90% of investing success is mindset. And mindset is forged through experience—ideally, guided experience where someone who has navigated these moments thousands of times can help you stay the course when every instinct screams otherwise.

"We're really, really bad at selling losses. There are rules to that, automations that can solve that, but naturally, we're not very good at that." — Felix Prehn

From Knowledge to Mastery

Consider what you now hold in your hands. This playbook contains:

- The complete week-by-week action plan for 90 days
- The three Power Moves that institutional investors use
- The specific rules for entry, exit, and risk management
- Real case studies with historical evidence
- Self-assessment tools to measure your progress

In other words, you have the **what** and the **when**. What you may not yet have is the **how**—the skill-level competence to execute each step with the confidence that comes from practice, feedback, and guided experience.

THE MENTORSHIP ADVANTAGE

Every legendary investor learned from a mentor. Warren Buffett learned from Benjamin Graham. Peter Lynch learned at Fidelity. Carl Icahn learned from Dreyfus Corporation. Felix Prehn learned from Wall Street mentors during his investment banking career. **None of them figured it out alone.**

This is not coincidence. It is the nature of skill acquisition. As Felix puts it: *"Would you have figured out those three rules on your own? It isn't intuitive, is it?"*

The Three Paths Forward

Path	Timeline to Proficiency	Risk Level
Self-Directed Learning	2–5 years of trial and error	High — mistakes made with real capital
This Playbook + Free Resources	6–12 months with consistent effort	Moderate — structured approach reduces errors
Guided Mentorship + This Playbook	90 days to execution-level competence	Lowest — feedback loop prevents costly mistakes

What One-on-One Coaching Actually Looks Like

On a coaching call with one of the Goat Academy mentors—former Wall Street professionals—you share your screen, show the chart you are analyzing, and walk through your reasoning. The mentor confirms what you got right, identifies what you missed, and calibrates your understanding in real time. They review your stop placements, your position sizes, and your emotional responses. Over weeks, you develop the confidence to execute independently—because you have been *practicing under supervision*, not just reading about it.

BOTTOM LINE: This playbook gives you the roadmap. But a roadmap without driving skill is just a pretty piece of paper. The fastest, most capital-efficient path from where you are to where you want to be is one that combines this systematic plan with the guidance of someone who has walked the path before you. That is not a sales pitch—it is the same conclusion that every legendary investor in history has reached.

Where You Are vs. Where You Want to Be

One of Felix's early mentors drew this on a whiteboard during their first meeting:

He asked Felix: *"What's in between?"*

Not hard work—you have already worked hard to get where you are. Not intelligence—some of the best investors are not the smartest people in the room. Not luck—luck is what happens when you have no system.

The answer is skills.

Skills are learnable. Skills are teachable. Skills are the only thing standing between the plan in your hands and the results you want in your portfolio.

THE INVESTMENT IN YOURSELF

You spend 40–60 hours per week earning money. You spend 2 weeks researching a vacation. You spend hours comparing phone plans, car insurance rates, and appliance models.

The question is: How much time are you willing to invest in learning the skill that could determine whether those 40–60 hours per week continue for 10 more years—or whether you build enough skill to make that choice optional?

Your Personal Action Plan — Write It Here

Step 1: What is your primary "Why" for becoming a better investor?

Step 2: Which of the 5 critical skills is your biggest gap?

Step 3: What will you do in the next 7 days to begin closing that gap?

Your Immediate Action Items

Do not let this playbook become "shelf help." The difference between investors who transform their results and those who remain frustrated is **one thing: action within 24 hours.**

IN THE NEXT 24 HOURS

- ▶ **Re-read the three Power Moves sections** and ensure you can explain each concept in your own words. If you can teach it, you understand it.
- ▶ **Set up your tools:** Create volume alerts on at least 5 stocks you are interested in. Use the 300% threshold as your starting point.
- ▶ **Practice pattern recognition:** Pull up 10 random stock charts and try to identify heartbeat patterns. Note which ones have volume spikes and which do not.
- ▶ **Write your "Why" statement** and post it where you will see it every day.
- ▶ **Schedule your first weekly review session** — same day, same time, every week, starting this week.

IN THE NEXT 7 DAYS

- ▶ Complete the Skill Gap Assessment on page 20
- ▶ Begin building your first watchlist of 5–10 stocks showing potential patterns
- ▶ Study one case study in depth: Tesla, Palantir, or Rocket Lab
- ▶ Set up your tracking spreadsheet for the full 90-day journey

IN THE NEXT 30 DAYS

- ▶ Complete all Month 1 milestones (see page 24)
- ▶ Paper trade first — before committing real money, practice the system with at least 6 simulated trades
- ▶ Evaluate whether you need guided mentorship to accelerate your skill development

Resources & Next Steps

Resource	What It Provides	Link
Felix's YouTube Channel	Weekly market analysis, chart reviews, educational content	youtube.com/felixfriends
Free Resources Page	Additional educational materials and tools	felixfriends.org/getfree
Free Strategy Call	One-on-one conversation with a specialist	justoneconversation.com

Recommended Brokers

Location	Recommended Platform	Notes
United States	Thinkorswim (by Schwab)	Easy to use, powerful charting; Felix's primary platform
International	Interactive Brokers (IBKR)	Less elegant interface but equally powerful; works globally
Any location	Your existing broker	If you already have a broker, use it—no need to switch

A Note on Tax

Taxes should never influence whether you buy or sell a stock. Handle tax optimization separately: consult a tax advisor once, establish your tax-efficient structure (e.g., Roth IRA in the US), and then never let tax considerations interfere with your trading decisions. Would you rather have \$700 (after 30% tax on a \$1,000 gain) or \$0 (because you never made the trade)?
